MyFlag

Description

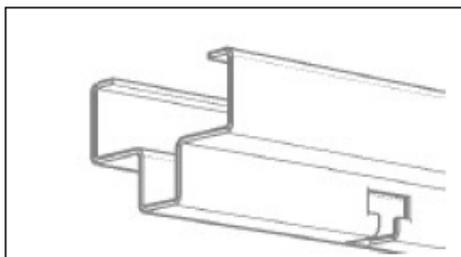

Myflag is a system of ceiling-suspended vertical leaves, creating a conceptual aesthetic with a specific configuration that helps to lessen the reverb. The size and spacing of the leaves are calculated each time according to the architectural characteristics of the space, without affecting the general dimensions of the room or impeding access to existing technical fixtures.

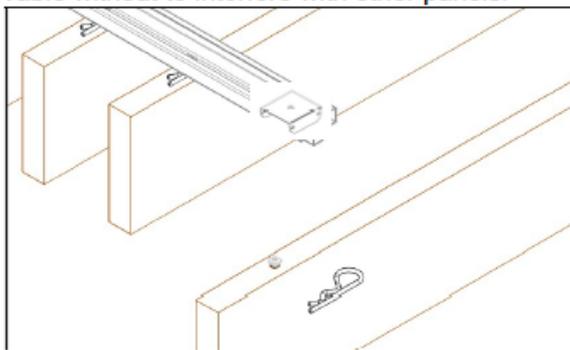

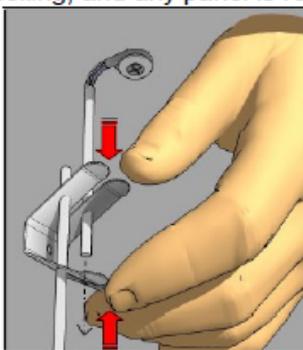

The panels are edged on 4 sides with colour to match the panel.

The installation system is based on metal profile, black mat colour.

The profile is machined with appropriate cuts to receive the hanging screw fixed on the panels and permit installation of the panels at 128 mm axis one to the other.

The profile can be suspended by appropriate bracket and hangers with regulation spring as per standard ceiling, and any panel is removable without to interfere with other panels.

The system includes special cotter pins for panel anti-fall safety.

Dimension and distance between panels can be customised under project request. Special finishes are available under request and depending from minimum quantity.
